Hi Taibi,

This is to confirm in writing something you & I have discussed in the past. While functioning as NASA's lead psychiatrist for manned space flight, I predicted significant crew friction between selected crew members on five occasions. The primary source of friction was commonly someone imposed upon the flight for political reasons. In four of the five instances, the conflict became visible in-flight. In the fifth instance, a crew member deemed vulnerable to the activities of the prime provocateur volunteered to me post-flight (I had tried to "immunize" him pre-flight)

"One more day & I'd have killed him."  
In each case, the behavioral predictions  
were based upon what I had learned  
from you & the studies of process  
communication through which you  
guided me.

With respect & appreciation,  
Terence J. McGuire PhD
